

XL LEDGER FRAME

TITAN's R&D team has given an industry staple a major upgrade with the new patented **TITAN XL Ledger Frame**. When used with our XL Shoring system, this new design brings heightened safety, stability, and efficiency to our projects. Here are the features that make the TITAN XL Ledger Frame unique:

- » A bolt-action-style clamp that rotates and draws into position upon initiation which provides maximum clearance between our XL shores during installation.
- » The lightweight aluminum frame coupled with a simple 2-stage wedge enables the ledger to be put into place by just one worker. The 2-stage wedge ensures a secure connection on both the inner and outer shore profile without separate indexing.
- » The curved wedge design improves mallet striking clearance while locking it into place.
- » The new clamp design is robust enough to safely act as a temporary scaffold when placing a plank across the top of two ledgers, supporting workers during erection or dismantle process.
- » A magnetic strip along the top middle of the ledger for placement of a magnetic level to ensure proper installation.
